Whole House Comfort Check Up

DT's can now test your home to see exactly what it is doing, and have your questions answered. We are trained through Comfort Institute in *Building Science* to find the problems which are causing: hot or cold spots, excessive dust, lingering or musty odors, high utility or repair bills, roof moisture or ice problems, and carbon monoxide (CO) issues. It is possible to solve these problems, and solve them **PERMANENTLY**.

Your home can have a carbon monoxide problem without even knowing it. Low amounts of CO can cause headaches, nausea and flu-like symptoms. Any gas appliance in your home can cause a CO problem. By having your house tested, you can detect a problem such as CO.

Comfort Institute has the technology to see what is happening in your walls, under floors, and all around your home. **DT's** technicians are specially trained to use this technology combined with industry standards to detect leaks and other inefficiencies in your home heating and cooling system; also testing your home for positive and negative pressures.

With an infrared camera we can see where cold/hot air is coming into the house. It can check for hot spots in your duct systems and much more.

Facts...

- Independent research shows that more than 9 out of 10 homes – even new homes – have leaks or other air problems
- According to the Department of Energy, typical duct systems lose 25 to 40% of the heating or cooling energy put out by the central furnace, heat pump or air conditioner.
- Recent studies have shown that indoor air is often more polluted than outdoor air.
- Americans spend about 90% of their time indoors! 65% of that time is spent in our own homes.
- The key to mold control is moisture control (EPA).
- EPA's most recent health risk assessment estimates that 20,000 lung cancer deaths each year are due to radon.
- 20,000 people go to the hospital each year because of Carbon Monoxide (CO) poisoning and about 500 die each year from it.
